

A Solution to Climate Change

Our climate is changing and scientific consensus is predicting dire consequences within 80 years, possibly less as models so far, are under predicting change. The question is "What is the solution?" There are two schools of thought using technology and natural earth processes. The first school includes "geo-engineering" with things like aerosols in the stratosphere and other inadequately researched to date proposals and other technology solutions that were recently listed in "The draw down," edited by Paul Hawkins, in which are discussed a 100 technology solutions like solar and wind energy. The second is "geo-therapy"...Using natural processes starting with photosynthesis and changing our agricultural paradigm. Professor Walker Miller, retired Clemson 99 and farming with his family at The Happy Berry, will argue for/discuss the latter with a presentation entitled "Climate Change: Adaptation and Mitigation."
